Abstract

Leptoquarks (LQs) have attracted increasing attention within recent years, mainly since they can explain the flavor anomalies found in $R(D^{(*)})$, $b \rightarrow s\ell^+\ell^-$ transitions and the anomalous magnetic moment of the muon. In this article, we lay the groundwork for further automated analyses by presenting the complete Lagrangian and the corresponding set of Feynman rules for scalar leptoquarks. This means we consider the five representations $\Phi_1, \Phi_{\bar{1}}, \Phi_2, \Phi_{\bar{2}}$ and Φ_3 and include the triple and quartic self-interactions, as well as couplings to the Standard Model (SM) fermions, gauge bosons and the Higgs. The calculations are performed using FeynRules and all model files are publicly available online at <https://gitlab.com/lucschnell/SLQrules>.

PROGRAM SUMMARY

Program Title: SLQrules

CPC Library link to program files: (to be added by Technical Editor)

Developer's repository link: <https://gitlab.com/lucschnell/SLQrules>

Code Ocean capsule: (to be added by Technical Editor)

Licensing provisions: CC By 4.0

Programming language: Mathematica, FeynRules

Nature of problem: In order to explain the deviations from SM predictions in $R(D^{(*)})$, $b \rightarrow \ell^+ \ell^-$ transitions and the muon AMM jointly, models involving multiple LQ representations are necessary. This significantly increases the number of possible interactions and creates the need for computational tools that allow for studying the phenomenology of these LQ models in an automated manner. While model files exist for each LQ representation individually [1], we are not aware of any publicly available model files that combine all scalar LQ representations as well as their self-interactions.

Solution method: We implemented the complete scalar LQ Lagrangian in a FeynRules [2] model file and provide the corresponding MOD and UFO model files. These can be imported directly in FeynArts [3] and MadGraph [4] to obtain a versatile toolbox for the study of scalar LQs.

1. Introduction

Leptoquarks (LQs) are hypothetical beyond the Standard Model (BSM) particles that were first proposed in the context of Grand Unified Theories [1–4]. What makes them stand out, and defines them, are their direct couplings to leptons and quarks (i.e. they convert a quark into a lepton and vice versa). LQs were first systematically classified in Ref. [5], where ten possible LQ representations under the Standard Model (SM) gauge group were found, of which five are scalar (spin 0) and five are vector (spin 1) particles. While they have received varying degrees of attention since then, LQs have undergone a renaissance in recent years. This can be attributed to the emergence of observed flavor anomalies, i.e. the deviations from the SM predictions measured in several flavour observables. In particular, $R(D^{(*)})$ [6–11], $b \rightarrow s\ell^+\ell^-$ observables [12–18] and the muon anomalous magnetic moment a_μ [19, 20] deviate from their SM predictions by $> 3\sigma$ [21–25], $> 5\sigma$ [26–33] and $> 4.2\sigma$ [34], respectively. Recently, the authors of Ref. [35] unveiled a further $\approx 4\sigma$ tension with the SM prediction in the forward-backward asymmetry of $\bar{B} \rightarrow D^*\ell\nu$. While these hints for new physics are by themselves interesting, it is intriguing to note that they all fall into a common pattern, namely lepton flavour universality violation.

Models with LQs can account for $b \rightarrow s\ell^+\ell^-$ data [36–63], $R(D^{(*)})$ [36, 37, 39–43, 45–47, 49, 50, 54–57, 59–98] and/or a_μ [59, 60, 62, 68, 76, 79, 82, 93, 98–117], making them prime NP candidates. Also the deviation in the $\bar{B} \rightarrow D^*\ell\nu$ forward-backward asymmetry can be explained with LQs, as was pointed out by Ref. [118]. As a result, LQs have been studied in direct searches at LHC [119–135], leptonic observables [136] and oblique electroweak (EW) parameters, Higgs couplings to gauge bosons [137–142] and a wide range of low energy precision probes [103, 135, 143–163].

Many models that are now being proposed to explain the flavour anomalies jointly contain multiple scalar leptoquark representations [59–63, 68, 93, 95, 114, 116, 164, 165]. In addition to couplings of LQs to the SM fermions and gauge bosons, also interactions with the particles of the Higgs sector and between the LQs themselves are present in such a setup. In this article, we lay the groundwork for future automated LQ analyses by presenting the complete set of Feynman rules for all five scalar LQs. We include the LQ-LQ-Higgs(-Higgs), LQ-LQ-LQ(-Higgs) and LQ-LQ-LQ-LQ couplings, as well as all couplings to the SM fermions and gauge bosons. The FeynRules [166] model files as well as the corresponding MOD and UFO files

are publicly available online at <https://gitlab.com/lucschnell/SLQrules> and can be used for automatized LQ phenomenology using FeynArts [167] or MadGraph [168].

In Sections 2 and 3, we present our conventions by defining the complete Lagrangian for the SM extended with all five scalar LQ representations. Sec. 4 gives an overview on the computational tools and in Sec. 5, the Feynman rules for the SM interactions are listed, while the ones for the scalar LQs are given in Sec. 6. A detailed description of our treatment of charge-conjugate fermions can be found in Appendix A.

2. SM Lagrangian

The SM fermions and the Higgs field transform under the $SU(3)_c \times SU(2)_L \times U(1)_Y$ gauge group as

	Q'_i	u'_i	d'_i	L'_i	ℓ'_i	H
$SU(3)_c$	3	3	3	1	1	1
$SU(2)_L$	2	1	1	2	1	2
$U(1)_Y$	$\frac{1}{6}$	$\frac{2}{3}$	$-\frac{1}{3}$	$-\frac{1}{2}$	-1	$\frac{1}{2}$

(1)

The prime indicates that these are the weak eigenstates. With this convention, the electric charge Q can be calculated via the Gell-Mann-Nishijima formula

$$Q = I_3 + Y, \quad (2)$$

where Y is the $U(1)_Y$ hypercharge and I_3 the third component of the weak isospin. The left-handed quarks are components of the $SU(2)_L$ -doublet Q' and the right-handed ones correspond to the singlets u', d'

$$Q'_i = \begin{pmatrix} u'_{i,L} \\ d'_{i,L} \end{pmatrix}, \quad u'_i = (u'_{i,R}) \text{ and } d'_i = (d'_{i,R}), \quad (3)$$

where $i = 1, 2, 3$ is the flavor index. Analogous conventions hold for the leptons

$$L'_i = \begin{pmatrix} \nu'_{i,L} \\ \ell'_{i,L} \end{pmatrix} \text{ and } \ell'_i = (\ell'_{i,R}). \quad (4)$$

Note that right-handed neutrinos are not considered in this work. The SM Lagrangian then takes the form

$$\begin{aligned}\mathcal{L}^{\text{SM}} = & -\frac{1}{4}B^{\mu\nu}B_{\mu\nu} - \frac{1}{4}W^{I,\mu\nu}W_{I,\mu\nu} - \frac{1}{4}G^{\alpha,\mu\nu}G_{\alpha,\mu\nu} \\ & + i(\bar{Q}'^\dagger \not{D} Q'_i) + i(\bar{L}'^\dagger \not{D} L'_i) + i\bar{u}'_i \not{D} u'_i + i\bar{d}'_i \not{D} d'_i + i\bar{\ell}'_i \not{D} \ell'_i \\ & + \left((D^\mu H)^\dagger D_\mu H \right) + \mu_H^2 (H^\dagger H) - \lambda_H (H^\dagger H)^2 \\ & - \left(Y_{ij}^d (\bar{Q}'^\dagger H) d'_j + Y_{ij}^\ell (\bar{L}'^\dagger H) \ell'_j + Y_{ij}^u (\bar{Q}'^\dagger \tilde{H}) u'_j + \text{h.c.} \right) \\ & + \mathcal{L}_{\text{gauge-fixing}}.\end{aligned}\quad (5)$$

We use brackets to indicate the $SU(2)_L$ contractions and denote the transpose of a $SU(2)_L$ multiplet Φ as Φ^\dagger . $B^{\mu\nu}, W^{I,\mu\nu}$ (with $I \in \{1, 2, 3\}$) and $G^{\alpha,\mu\nu}$ (with $\alpha \in \{1, \dots, 8\}$) are the field strength tensors

$$\begin{aligned}B_{\mu\nu} &= \partial_\mu B_\nu - \partial_\nu B_\mu, \\ W_{\mu\nu}^I &= \partial_\mu W_\nu^I - \partial_\nu W_\mu^I + g f^{IJK} W_\mu^J W_\nu^K, \\ G_{\mu\nu}^\alpha &= \partial_\mu G_\nu^\alpha - \partial_\nu G_\mu^\alpha + g f^{\alpha\beta\gamma} W_\mu^\beta W_\nu^\gamma,\end{aligned}\quad (6)$$

where $B_\mu, W_\mu^I, G_\mu^\alpha$ are the gauge fields corresponding to $U(1)_Y$, $SU(2)_L$ and $SU(3)_c$, respectively. $f^{IJK}, f^{\alpha\beta\gamma}$ denote the structure constants of $SU(2)_L$, $SU(3)_c$. Y^d, Y^ℓ, Y^u are the Yukawa couplings and $\tilde{H} \equiv i\sigma_2 H^\dagger$, where σ_2 is the second Pauli matrix. In our conventions, the Pauli matrices are given by

$$\sigma_1 = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}, \sigma_2 = \begin{pmatrix} 0 & -i \\ i & 0 \end{pmatrix}, \sigma_3 = \begin{pmatrix} 1 & 0 \\ 0 & -1 \end{pmatrix}. \quad (7)$$

The covariant derivative is defined as

$$D_\mu \phi = \partial_\mu \phi - ig_1 Y B_\mu \phi - ig_2 \tau_I W_\mu^I \phi - ig_s T_\alpha G_\mu^\alpha \phi, \quad (8)$$

with $I \in \{1, 2, 3\}$, $\alpha \in \{1, \dots, 8\}$. $\tau_I = \frac{\sigma_I}{2}, T_\alpha = \frac{\lambda_\alpha}{2}$ refer to the generators of the fundamental $SU(2)_L$, $SU(3)_c$ representations here. The gauge-fixing part $\mathcal{L}_{\text{gauge-fixing}}$ of the Lagrangian is described in Eq. (21).

Having acquired a non-zero vacuum expectation value (VEV) $v \approx 246$ GeV after spontaneous symmetry breaking, the Higgs doublet H can be expanded in modes around v

$$H = \begin{pmatrix} -i\varphi^+ \\ \frac{v+h+i\varphi_Z}{\sqrt{2}} \end{pmatrix}, \quad (9)$$

where φ^+ and φ_Z are the Goldstone bosons and h the physical Higgs field with $m_h \approx 125$ GeV. Expressed in terms of the couplings μ_H, λ_H (see Eq. (5)), the parameters v, m_h read

$$\begin{aligned} m_h &= \sqrt{2}\mu_H, \\ v &= \frac{\mu_H}{\sqrt{\lambda_H}}. \end{aligned} \quad (10)$$

The non-vanishing VEV leads to mixing of the $U(1)_Y$ gauge boson with the neutral component of the $SU(2)_L$ ones

$$\begin{pmatrix} A_\mu \\ Z_\mu \end{pmatrix} = \begin{pmatrix} \cos \theta_w & \sin \theta_w \\ -\sin \theta_w & \cos \theta_w \end{pmatrix} \begin{pmatrix} B_\mu \\ W_\mu^3 \end{pmatrix}, \quad (11)$$

where θ_w is the Weinberg angle. The remaining two $SU(2)_L$ gauge bosons form electric charge eigenstates

$$W_\mu^\pm = \frac{1}{\sqrt{2}} (W_\mu^1 \mp iW_\mu^2). \quad (12)$$

In the following, $\cos \theta_w, \sin \theta_w$ will be abbreviated as c_w, s_w . Instead of using the coupling constants g_1, g_2 directly, we will state the Feynman rules using the electric charge e . The conversion back to g_1, g_2 is easily carried out using

$$\begin{aligned} e &= c_w g_1, \\ e &= s_w g_2. \end{aligned} \quad (13)$$

The masses acquired by the gauge bosons in Eqs. (11) and (12) via spontaneous symmetry breaking are

$$\begin{aligned} m_A &= 0, \\ m_W &= \frac{v}{2} \frac{e}{s_w}, \\ m_Z &= \frac{v}{2} \frac{e}{s_w c_w}, \end{aligned} \quad (14)$$

from which it becomes clear that A_μ corresponds to the photon. As stated above, Y^d, Y^u, Y^ℓ denote the Yukawa couplings of the Higgs doublet for the down-type quarks, up-type quarks and leptons, respectively. After spontaneous symmetry breaking, they yield non-diagonal mass terms in the weak

basis

$$\begin{aligned} m_{ij}^u \bar{u}'_i u'_j &= \frac{v}{\sqrt{2}} Y_{ij}^u \bar{u}'_i u'_j, \\ m_{ij}^d \bar{d}'_i d'_j &= \frac{v}{\sqrt{2}} Y_{ij}^d \bar{d}'_i d'_j, \\ m_{ij}^\ell \bar{\ell}'_i \ell'_j &= \frac{v}{\sqrt{2}} Y_{ij}^\ell \bar{\ell}'_i \ell'_j. \end{aligned} \quad (15)$$

These can be diagonalized by rotating the fermion fields

$$\begin{aligned} u'_{i,L} &\equiv U_{ij}^{uL} u_{j,L}, & u'_{i,R} &\equiv U_{ij}^{uR} u_{j,R}, \\ d'_{i,L} &\equiv U_{ij}^{dL} d_{j,L}, & d'_{i,R} &\equiv U_{ij}^{dR} d_{j,R}, \\ \ell'_{i,L} &\equiv U_{ij}^{\ell L} \ell_{j,L}, & \ell'_{i,R} &\equiv U_{ij}^{\ell R} \ell_{j,R}, \end{aligned} \quad (16)$$

where $U^{uL}, U^{uR}, U^{dL}, U^{dR}, U^{\ell L}, U^{\ell R}$ are unitary matrices, u', d', ℓ' the weak eigenstates and u, d, ℓ the mass eigenstates. The Yukawa couplings in this new basis

$$\begin{aligned} \hat{Y}^u &\equiv (U^{uL})^\dagger Y^u U^{uR}, \\ \hat{Y}^d &\equiv (U^{dL})^\dagger Y^d U^{dR}, \\ \hat{Y}^\ell &\equiv (U^{\ell L})^\dagger Y^\ell U^{\ell R}, \end{aligned} \quad (17)$$

are diagonal and are related to the fermion masses by

$$\begin{aligned} \frac{v}{\sqrt{2}} \hat{Y}^u &= \text{diag}(m_{u_1}, m_{u_2}, m_{u_3}), \\ \frac{v}{\sqrt{2}} \hat{Y}^d &= \text{diag}(m_{d_1}, m_{d_2}, m_{d_3}), \\ \frac{v}{\sqrt{2}} \hat{Y}^\ell &= \text{diag}(m_{\ell_1}, m_{\ell_2}, m_{\ell_3}). \end{aligned} \quad (18)$$

The unitary matrices in Eq. (16) can for the most part be absorbed into redefinitions of the fermion fields, the only remaining physical matrix being in the weak charged current for quarks, the CKM matrix V

$$\begin{aligned} \mathcal{L}^{SM} &\supset \frac{e}{\sqrt{2}s_w} W_\mu^+ \bar{u}'_{i,L} \gamma^\mu d'_{i,L} + \text{h.c.} \\ &= \frac{e}{\sqrt{2}s_w} W_\mu^+ \bar{u}_{k,L} \gamma^\mu \underbrace{(U^{uL})_{ki}^\dagger (U^{dL})_{il}}_{V_{kl}} d_{l,L} + \text{h.c.} \end{aligned} \quad (19)$$

Without loss of generality, we can therefore assume that the relations between the weak eigenstates u', d', ℓ', ν' and the mass eigenstates u, d, ℓ, ν take the form

$$\begin{aligned} u'_{i,L} &= u_{i,L}, & u'_{i,R} &= u_{i,R}, \\ d'_{i,L} &= V_{ij} d_{j,L}, & d'_{i,R} &= d_{i,R}, \\ \ell'_{i,L} &= \ell_{i,L}, & \ell'_{i,R} &= \ell_{i,R}, \\ \nu'_{i,L} &= \nu_{i,L}, \end{aligned} \tag{20}$$

meaning that CKM elements only appear in couplings involving left-handed down-type quarks (corresponding to the up basis). Note that while this choice does not affect the SM Feynman rules, it becomes relevant in LQ interactions with SM fermions. The gauge freedoms of the SM gauge bosons are given in Ref. [169] (our conventions correspond to $\eta_Y, \eta_Z, \eta_\theta, \eta_G = 1$ and $\eta, \eta_s, \eta_e, \eta' = -1$). They are fixed using the Fadeev-Popov prescription [170]. Working in the Feynman gauge, we add the following gauge-fixing terms, after spontaneous symmetry breaking and expressed in terms of the physical fields $A_\mu, Z_\mu, W_\mu^\pm, G_\mu^\alpha$ and their corresponding ghost fields $c_A, c_Z, c_{W^\pm}, c_{G^\alpha}$, to the Lagrangian

$$\begin{aligned} \mathcal{L}_{\text{gauge-fixing}} = & -\frac{1}{2} (\partial^\mu A_\mu)^2 - \frac{1}{2} (\partial^\mu Z_\mu - m_Z \varphi_Z)^2 \\ & - (\partial^\mu W_\mu^- + i m_W \varphi^-) (\partial^\mu W_\mu^+ - i m_W \varphi^+) \\ & - \frac{1}{2} (\partial^\mu G_\mu^\alpha)^2 \\ & + \sum_{B \in \{A, Z, W^\pm\}} \left(\bar{c}_{W^+} \frac{\partial(\delta F_{W^+})}{\partial \alpha_B} + \bar{c}_{W^-} \frac{\partial(\delta F_{W^+})}{\partial \alpha_B} \right. \\ & \quad \left. + \bar{c}_Z \frac{\partial(\delta F_Z)}{\partial \alpha_B} + \bar{c}_A \frac{\partial(\delta F_A)}{\partial \alpha_B} \right) c_B \\ & + \sum_{\alpha, \beta=1}^8 \bar{c}_{G^\alpha} \frac{\partial(\delta F_{G^\alpha})}{\partial \alpha_{G^\beta}} c_{G^\beta}. \end{aligned} \tag{21}$$

The explicit expressions for $\delta F_{W^+}, \delta F_Z, \delta F_A, \delta F_{G^\alpha}$ are given in Ref. [169].

3. LQ Lagrangian

The five possible scalar LQ representations $\Phi_1, \Phi_{\tilde{1}}, \Phi_2, \Phi_{\tilde{2}}, \Phi_3$ transform under the $SU(3)_c \times SU(2)_L \times U(1)_Y$ gauge group as [5]

	Φ_1	$\Phi_{\tilde{1}}$	Φ_2	$\Phi_{\tilde{2}}$	Φ_3
$SU(3)_c$	3	3	3	3	3
$SU(2)_L$	1	1	2	2	3
$U(1)_Y$	$-\frac{1}{3}$	$-\frac{4}{3}$	$\frac{7}{6}$	$\frac{1}{6}$	$-\frac{1}{3}$

(22)

Note that we adopt the convention that all scalar LQs transform in the fundamental $SU(3)_c$ representation. Expanding the $SU(2)_L$ multiplets into their components, the following electric charge eigenstates are found

$$\begin{aligned} \Phi_1 &= \left(\Phi_1^{-1/3} \right), \quad \Phi_{\tilde{1}} = \left(\Phi_{\tilde{1}}^{-4/3} \right), \quad \Phi_2 = \begin{pmatrix} \Phi_2^{+5/3} \\ \Phi_2^{+2/3} \end{pmatrix}, \\ \Phi_{\tilde{2}} &= \begin{pmatrix} \Phi_{\tilde{2}}^{+2/3} \\ \Phi_{\tilde{2}}^{-1/3} \end{pmatrix}, \quad \sigma \cdot \Phi_3 = \begin{pmatrix} \Phi_3^{-1/3} & \sqrt{2}\Phi_3^{+2/3} \\ \sqrt{2}\Phi_3^{-4/3} & -\Phi_3^{-1/3} \end{pmatrix}. \end{aligned} \quad (23)$$

We decompose the scalar LQ Lagrangian as

$$\mathcal{L}^{\text{LQ}} = \mathcal{L}_{2\Phi} + \mathcal{L}_{\text{kin}} + \mathcal{L}_f + \mathcal{L}_{3\Phi} + \mathcal{L}_{4\Phi}, \quad (24)$$

where $\mathcal{L}_{2\Phi}$ contains the LQ masses and the LQ-LQ-Higgs(-Higgs) couplings, \mathcal{L}_{kin} the kinetic terms and the couplings to the SM gauge bosons, \mathcal{L}_f the couplings to the SM fermions, $\mathcal{L}_{3\Phi}$ the LQ-LQ-LQ(-Higgs) couplings and finally $\mathcal{L}_{4\Phi}$ the LQ-LQ-LQ-LQ interaction terms. The individual parts of the Lagrangians are discussed in more detail below.

3.1. LQ Masses and Higgs Interactions ($\mathcal{L}_{2\Phi}$)

The LQ masses and the LQ-LQ-Higgs(-Higgs) interactions are implemented by the Lagrangian [142, 171]

$$\begin{aligned} \mathcal{L}_{2\Phi} = & - \sum_{a=1}^3 (m_a^2 + Y_a (H^\dagger H)) (\Phi_a^\dagger \Phi_a) - \sum_{a=1}^2 (m_{\tilde{a}}^2 + Y_{\tilde{a}} (H^\dagger H)) (\Phi_{\tilde{a}}^\dagger \Phi_{\tilde{a}}) \\ & - Y_{22} (H^\dagger i\sigma_2 \Phi_2)^\dagger (H^\dagger i\sigma_2 \Phi_2) - Y_{\tilde{2}\tilde{2}} (H^\dagger i\sigma_2 \Phi_{\tilde{2}})^\dagger (H^\dagger i\sigma_2 \Phi_{\tilde{2}}) \\ & - iY_{33} \epsilon^{IJK} (H^\dagger \sigma^I H) \Phi_3^{J\dagger} \Phi_3^K \\ & \left[- A_{1\tilde{2}} (\Phi_{\tilde{2}}^\dagger H) \Phi_1 + A_{\tilde{2}3} (\Phi_{\tilde{2}}^\dagger (\sigma \cdot \Phi_3) H) + Y_{2\tilde{2}} (\Phi_2^\dagger H) (H^\dagger i\sigma_2 \Phi_{\tilde{2}}) \right. \\ & \left. + Y_{\tilde{1}3} (H^\dagger i\sigma_2 (\sigma \cdot \Phi_3)^\dagger H) \Phi_{\tilde{1}} + Y_{13} (H^\dagger (\sigma \cdot \Phi_3) H) \Phi_1^\dagger + \text{h.c.} \right]. \end{aligned} \quad (25)$$

The color indices are omitted since they just involve trivial contractions. For example, the term with Y_{22} in Eq. (25) would be $-Y_{22} (H^\dagger i\sigma_2 \Phi_{2,c_1})^\dagger (H^\dagger i\sigma_2 \Phi_{2,c_1})$ in full notation. We use the convention that couplings with mass dimension one (zero) are denoted by A (Y).

The terms in Eq. (25) lead to mixing among the LQ eigenstates of the same electric charge after EW symmetry breaking. It is therefore convenient to collect them in the electric charge eigenstate vectors

$$\begin{aligned} \Phi^{-1/3} &\equiv \begin{pmatrix} \Phi_1^{-1/3} \\ \Phi_{\tilde{2}}^{-1/3} \\ \Phi_3^{-1/3} \end{pmatrix}, \quad \Phi^{+2/3} \equiv \begin{pmatrix} \Phi_2^{+2/3} \\ \Phi_{\tilde{2}}^{+2/3} \\ \Phi_3^{+2/3} \end{pmatrix}, \\ \Phi^{-4/3} &\equiv \begin{pmatrix} \Phi_{\tilde{1}}^{-4/3} \\ \Phi_3^{-4/3} \end{pmatrix}, \quad \Phi^{+5/3} \equiv \begin{pmatrix} \Phi_2^{+5/3} \end{pmatrix}. \end{aligned} \quad (26)$$

After spontaneous symmetry breaking, non-diagonal mass matrices \mathbb{M}^q in

$$\mathcal{L}_{2\Phi} \supset - \sum_{q \in Q} \Phi^{q\dagger} \mathbb{M}^q \Phi^q \quad (27)$$

are generated with $Q = \{-\frac{4}{3}, -\frac{1}{3}, +\frac{2}{3}, +\frac{5}{3}\}$ and [142, 171, 172]

$$\begin{aligned} \mathbb{M}^{-1/3} &= \begin{pmatrix} m_1^2 + \frac{v^2}{2} Y_1 & \frac{v}{\sqrt{2}} A_{1\tilde{2}}^* & \frac{v^2}{2} Y_{13} \\ \frac{v}{\sqrt{2}} A_{1\tilde{2}} & m_2^2 + \frac{v^2}{2} Y_{\tilde{2}} & \frac{v}{\sqrt{2}} A_{\tilde{2}3} \\ \frac{v^2}{2} Y_{13}^* & \frac{v}{\sqrt{2}} A_{\tilde{2}3}^* & m_3^2 + \frac{v^2}{2} Y_3 \end{pmatrix}, \\ \mathbb{M}^{+2/3} &= \begin{pmatrix} m_2^2 + \frac{v^2}{2} Y_2 & \frac{v^2}{2} Y_{2\tilde{2}} & 0 \\ \frac{v^2}{2} Y_{\tilde{2}2}^* & m_2^2 + \frac{v^2}{2} (Y_{\tilde{2}} + Y_{\tilde{2}\tilde{2}}) & -v A_{\tilde{2}3} \\ 0 & -v A_{\tilde{2}3}^* & m_3^2 + \frac{v^2}{2} (Y_3 + Y_{33}) \end{pmatrix}, \quad (28) \\ \mathbb{M}^{-4/3} &= \begin{pmatrix} m_{\tilde{1}}^2 + \frac{v^2}{2} Y_{\tilde{1}} & \frac{v^2}{\sqrt{2}} Y_{\tilde{1}3}^* \\ \frac{v^2}{\sqrt{2}} Y_{\tilde{1}3} & m_3^2 + \frac{v^2}{2} (Y_3 - Y_{33}) \end{pmatrix}, \\ \mathbb{M}^{+5/3} &= m_2^2 + \frac{v^2}{2} (Y_2 + Y_{22}). \end{aligned}$$

They can be diagonalized by rotating the LQs with unitary matrices

$$W^q \Phi^q \equiv \hat{\Phi}^q, \quad (29)$$

in order to arrive at the physical basis with diagonal mass matrices. W^q can be calculated perturbatively to arbitrary order in v [142, 173]. At $\mathcal{O}(v^2)$ one finds

$$\begin{aligned} W^{-1/3} &\approx \begin{pmatrix} 1 - \frac{v^2 |A_{1\tilde{2}}|^2}{4(m_{1\tilde{2}}^2)^2} & \frac{v A_{1\tilde{2}}^*}{\sqrt{2} m_{1\tilde{2}}^2} & \frac{v^2 (Y_{13} m_{1\tilde{2}}^2 + A_{1\tilde{2}}^* A_{\tilde{2}3})}{2m_{13}^2 m_{1\tilde{2}}^2} \\ \frac{-v A_{1\tilde{2}}}{\sqrt{2} m_{1\tilde{2}}^2} & 1 - \frac{v^2}{4} \left(\frac{|A_{1\tilde{2}}|^2}{(m_{1\tilde{2}}^2)^2} + \frac{|A_{\tilde{2}3}|^2}{(m_{3\tilde{2}}^2)^2} \right) & \frac{-v A_{\tilde{2}3}}{\sqrt{2} m_{3\tilde{2}}^2} \\ \frac{-v^2 (Y_{13}^* m_{3\tilde{2}}^2 + A_{1\tilde{2}} A_{\tilde{2}3}^*)}{2m_{13}^2 m_{3\tilde{2}}^2} & \frac{v A_{\tilde{2}3}^*}{\sqrt{2} m_{3\tilde{2}}^2} & 1 - \frac{v^2 |A_{\tilde{2}3}|^2}{4(m_{3\tilde{2}}^2)^2} \end{pmatrix}, \\ W^{+2/3} &\approx \begin{pmatrix} 1 & \frac{v^2 Y_{2\tilde{2}}}{2m_{2\tilde{2}}^2} & 0 \\ \frac{-v^2 Y_{\tilde{2}2}^*}{2m_{2\tilde{2}}^2} & 1 - \frac{v^2 |A_{\tilde{2}3}|^2}{2(m_{3\tilde{2}}^2)^2} & \frac{-v A_{\tilde{2}3}}{m_{2\tilde{2}}^2} \\ 0 & \frac{v A_{\tilde{2}3}^*}{m_{2\tilde{2}}^2} & 1 - \frac{v^2 |A_{\tilde{2}3}|^2}{2(m_{3\tilde{2}}^2)^2} \end{pmatrix}, \quad W^{-4/3} \approx \begin{pmatrix} 1 & \frac{v^2 Y_{\tilde{1}3}^*}{\sqrt{2} m_{13}^2} \\ \frac{-v^2 Y_{\tilde{1}3}}{\sqrt{2} m_{13}^2} & 1 \end{pmatrix}, \\ W^{+5/3} &= 1, \end{aligned} \quad (30)$$

where $m_{ab}^2 \equiv m_a^2 - m_b^2$ for $a, b \in \{1, \tilde{1}, 2, \tilde{2}, 3\}$. The diagonal mass matrices

$$\hat{\mathbb{M}}^q \equiv W^q \mathbb{M}^q (W^q)^\dagger \quad (31)$$

then read [142]

$$\begin{aligned} \hat{\mathbb{M}}^{-1/3} &\approx \text{diag} \left(m_1^2 + \frac{v^2}{2} \left(Y_1 - \frac{|A_{1\tilde{2}}|^2}{m_{21}^2} \right), m_{\tilde{2}}^2 + \frac{v^2}{2} \left(Y_{\tilde{2}} + \frac{|A_{1\tilde{2}}|^2}{m_{21}^2} + \frac{|A_{\tilde{2}3}|^2}{m_{23}^2} \right), \right. \\ &\quad \left. m_3^2 + \frac{v^2}{2} \left(Y_3 - \frac{|A_{\tilde{2}3}|^2}{m_{23}^2} \right) \right), \\ \hat{\mathbb{M}}^{+2/3} &\approx \text{diag} \left(m_2^2 + \frac{v^2}{2} Y_2, m_{\tilde{2}}^2 + \frac{v^2}{2} \left(Y_{\tilde{2}} + Y_{\tilde{2}\tilde{2}} + \frac{2|A_{\tilde{2}3}|^2}{m_{23}^2} \right), \right. \\ &\quad \left. m_3^2 + \frac{v^2}{2} \left(Y_3 + Y_{33} - \frac{2|A_{\tilde{2}3}|^2}{m_{23}^2} \right) \right), \\ \hat{\mathbb{M}}^{-4/3} &\approx \text{diag} \left(m_1^2 + \frac{v^2}{2} Y_{\tilde{1}}, m_3^2 + \frac{v^2}{2} (Y_3 - Y_{33}) \right), \\ \hat{\mathbb{M}}^{+5/3} &= m_2^2 + \frac{v^2}{2} (Y_2 + Y_{22}), \end{aligned} \quad (32)$$

up to order v^2 .

The interactions of LQs with the Higgs field h are determined by

$$\begin{aligned} \mathcal{L}_{2\Phi} &\supset \sum_{q \in Q} (\Phi^{q\dagger} \mathbb{F}^q \Phi^q) h + \frac{1}{2} \sum_{q \in Q} (\Phi^{q\dagger} \Lambda^q \Phi^q) hh \\ &= \sum_{q \in Q} (\hat{\Phi}^{q\dagger} \hat{\mathbb{F}}^q \hat{\Phi}^q) h + \frac{1}{2} \sum_{q \in Q} (\hat{\Phi}^{q\dagger} \hat{\Lambda}^q \hat{\Phi}^q) hh, \end{aligned} \quad (33)$$

with

$$\mathbb{F}^{-1/3} = -v \begin{pmatrix} Y_1 & \frac{A_{1\tilde{2}}^*}{\sqrt{2}v} & Y_{13} \\ \frac{A_{1\tilde{2}}}{\sqrt{2}v} & Y_{\tilde{2}} & \frac{A_{\tilde{2}3}}{\sqrt{2}v} \\ Y_{13}^* & \frac{A_{\tilde{2}3}^*}{\sqrt{2}v} & Y_3 \end{pmatrix}, \quad \mathbb{F}^{+2/3} = -v \begin{pmatrix} Y_2 & Y_{2\tilde{2}} & 0 \\ Y_{2\tilde{2}}^* & Y_{\tilde{2}} + Y_{\tilde{2}\tilde{2}} & -\frac{A_{23}}{v} \\ 0 & -\frac{A_{23}^*}{v} & Y_3 + Y_{33} \end{pmatrix},$$

$$\begin{aligned}
\mathbb{F}^{-4/3} &= -v \begin{pmatrix} Y_{\tilde{1}} & \sqrt{2}Y_{\tilde{1}3}^* \\ \sqrt{2}Y_{\tilde{1}3} & Y_3 - Y_{33} \end{pmatrix}, \quad \mathbb{F}^{+5/3} = -v(Y_2 + Y_{22}), \\
\mathbb{A}^{-1/3} &= - \begin{pmatrix} Y_1 & 0 & Y_{13} \\ 0 & Y_{\tilde{2}} & 0 \\ Y_{13}^* & 0 & Y_3 \end{pmatrix}, \quad \mathbb{A}^{+2/3} = - \begin{pmatrix} Y_2 & Y_{2\tilde{2}} & 0 \\ Y_{2\tilde{2}}^* & Y_{\tilde{2}} + Y_{\tilde{2}\tilde{2}} & 0 \\ 0 & 0 & Y_3 + Y_{33} \end{pmatrix}, \\
\mathbb{A}^{-4/3} &= - \begin{pmatrix} Y_{\tilde{1}} & \sqrt{2}Y_{\tilde{1}3}^* \\ \sqrt{2}Y_{\tilde{1}3} & Y_3 - Y_{33} \end{pmatrix}, \quad \mathbb{A}^{+5/3} = - (Y_2 + Y_{22}),
\end{aligned} \tag{34}$$

and

$$\begin{aligned}
\hat{\mathbb{F}}^q &= W^q \mathbb{F}^q (W^q)^\dagger \text{ for } q \in Q, \\
\hat{\mathbb{A}}^q &= W^q \mathbb{A}^q (W^q)^\dagger \text{ for } q \in Q.
\end{aligned} \tag{35}$$

The explicit expressions for these coupling matrices up to $\mathcal{O}(v^2)$ are given in Ref. [142].

When listing the Feynman rules for interactions involving LQs of the same charge, we will have to relate the LQ label $a \in \{1, \tilde{1}, 2, \tilde{2}, 3\}$ to the position in Φ^q . For this we use the coefficients

$$n_a^q \text{ with } q \in \left\{-\frac{4}{3}, -\frac{1}{3}, +\frac{2}{3}, +\frac{5}{3}\right\} \text{ and } a \in \{1, \tilde{1}, 2, \tilde{2}, 3\}. \tag{36}$$

Explicitly, we have

n_a^q	$a = 1$	$a = \tilde{1}$	$a = 2$	$a = \tilde{2}$	$a = 3$
$q = -\frac{1}{3}$	1	0	0	2	3
$q = +\frac{2}{3}$	0	0	1	2	3
$q = -\frac{4}{3}$	0	1	0	0	2
$q = +\frac{5}{3}$	0	0	1	0	0

Whenever q is clear from the context, we write n_a^q as n_a to simplify the notation.

3.2. Kinetic Terms and Interactions with SM Gauge Bosons (\mathcal{L}_{kin})

The kinetic terms for the LQs as well as their couplings to the SM gauge bosons are presented in this section. The same conventions as for the SM are used. For the three-dimensional adjoint representation of $SU(2)_L$, the I^{th} generator ($I \in \{1, 2, 3\}$) has the 3×3 matrix form $(\tilde{\epsilon}_I)_{JK} \equiv i\epsilon_{IJK}$, where ϵ_{IJK} is the three-dimensional Levi-Civita tensor. We use the convention $\epsilon_{123} = +1$.

	\mathcal{L}_{kin}	D_μ	
Φ_1	$((D_\mu \Phi_1)^\dagger D^\mu \Phi_1)$	$\partial_\mu + \frac{i}{3}g_1 B_\mu - ig_s \frac{\lambda_\alpha}{2} G_\mu^\alpha$	
$\Phi_{\tilde{1}}$	$((D_\mu \Phi_{\tilde{1}})^\dagger D^\mu \Phi_{\tilde{1}})$	$\partial_\mu + \frac{4i}{3}g_1 B_\mu - ig_s \frac{\lambda_\alpha}{2} G_\mu^\alpha$	
Φ_2	$((D_\mu \Phi_2)^\dagger D^\mu \Phi_2)$	$\partial_\mu - \frac{7i}{6}g_1 B_\mu - ig_2 \frac{\sigma_I}{2} W_\mu^I - ig_s \frac{\lambda_\alpha}{2} G_\mu^\alpha$	
$\Phi_{\tilde{2}}$	$((D_\mu \Phi_{\tilde{2}})^\dagger D^\mu \Phi_{\tilde{2}})$	$\partial_\mu - \frac{i}{6}g_1 B_\mu - ig_2 \frac{\sigma_I}{2} W_\mu^I - ig_s \frac{\lambda_\alpha}{2} G_\mu^\alpha$	
Φ_3	$((D_\mu \Phi_3)^\dagger D^\mu \Phi_3)$	$\partial_\mu + \frac{i}{3}g_1 B_\mu - ig_2 \tilde{\epsilon}_I W_\mu^I - ig_s \frac{\lambda_\alpha}{2} G_\mu^\alpha$	

By definition, the Φ^q couple to the photon with the electric charge q . The couplings to the electroweak SM gauge bosons are given by

$$\begin{aligned} \mathcal{L}_{kin} \supset & i \frac{e}{s_w c_w} \sum_{q \in Q} \left(\Phi^{q\dagger} \mathbb{Z}^q \overset{\leftrightarrow}{\partial}{}^\mu \Phi^q \right) Z_\mu \\ & + i \frac{e}{s_w} \sum_{q \in Q \setminus \left\{ +\frac{5}{3} \right\}} \left((\Phi^{q+1})^\dagger \mathbb{W}_q^{q+1} \overset{\leftrightarrow}{\partial}{}^\mu \Phi^q \right) W_\mu^+, \end{aligned} \quad (38)$$

where $\Phi^\dagger \overset{\leftrightarrow}{\partial}{}^\mu \Phi \equiv \Phi^\dagger \partial^\mu \Phi - (\partial^\mu \Phi^\dagger) \Phi$, $Q = \left\{ -\frac{4}{3}, -\frac{1}{3}, +\frac{2}{3}, +\frac{5}{3} \right\}$ and

$$\begin{aligned} \mathbb{Z}^{-1/3} &= \begin{pmatrix} \frac{1}{3}s_w^2 & 0 & 0 \\ 0 & -\frac{1}{2} + \frac{1}{3}s_w^2 & 0 \\ 0 & 0 & \frac{1}{3}s_w^2 \end{pmatrix}, & \mathbb{Z}^{-4/3} &= \begin{pmatrix} \frac{4}{3}s_w^2 & 0 \\ 0 & -1 + \frac{4}{3}s_w^2 \end{pmatrix}, \\ \mathbb{Z}^{+2/3} &= \begin{pmatrix} -\frac{1}{2} - \frac{2}{3}s_w^2 & 0 & 0 \\ 0 & \frac{1}{2} - \frac{2}{3}s_w^2 & 0 \\ 0 & 0 & 1 - \frac{2}{3}s_w^2 \end{pmatrix}, & \mathbb{Z}^{+5/3} &= \left(\frac{1}{2} - \frac{5}{3}s_w^2 \right), \\ \mathbb{W}_{-1/3}^{+2/3} &= \begin{pmatrix} 0 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & -\sqrt{2} \end{pmatrix}, & \mathbb{W}_{-4/3}^{-1/3} &= \begin{pmatrix} 0 & 0 \\ 0 & 0 \\ 0 & \sqrt{2} \end{pmatrix}, & \mathbb{W}_{+2/3}^{+5/3} &= (1 \ 0 \ 0). \end{aligned} \quad (39)$$

Such interactions were first considered in Ref. [174]. Expressed in the mass basis for the LQs, they take the form

$$\begin{aligned} \mathcal{L}_{\text{kin}} \supset & +i \frac{e}{s_w c_w} \sum_{q \in Q} \left(\hat{\Phi}^{q\dagger} \hat{\mathbb{Z}}^q \overset{\leftrightarrow}{\partial}{}^\mu \hat{\Phi}^q \right) Z_\mu \\ & + i \frac{e}{s_w} \sum_{q \in Q \setminus \left\{ +\frac{5}{3} \right\}} \left(\left(\hat{\Phi}^{q+1} \right)^\dagger \hat{\mathbb{W}}_q^{q+1} \overset{\leftrightarrow}{\partial}{}^\mu \hat{\Phi}^q \right) W_\mu^+. \end{aligned} \quad (40)$$

with

$$\begin{aligned} \hat{\mathbb{Z}}^q &\equiv W^q \mathbb{Z}^q (W^q)^\dagger \text{ for } q \in Q, \\ \hat{\mathbb{W}}_q^{q+1} &\equiv W^{q+1} \mathbb{W}_q^{q+1} (W^q)^\dagger \text{ for } q \in Q \setminus \left\{ +\frac{5}{3} \right\}. \end{aligned} \quad (41)$$

Explicitly, the matrices $\hat{\mathbb{Z}}^q, \hat{\mathbb{W}}_q^{q+1}$ are given by

$$\begin{aligned} \hat{\mathbb{Z}}^{-1/3} &\approx \begin{pmatrix} \frac{1}{3}s_w^2 - \frac{v^2|A_{1\bar{2}}|^2}{4(m_{1\bar{2}}^2)^2} & -\frac{vA_{1\bar{2}}^*}{2\sqrt{2}m_{1\bar{2}}^2} & -\frac{v^2A_{\bar{2}3}A_{1\bar{2}}^*}{4m_{1\bar{2}}^2m_{3\bar{2}}^2} \\ -\frac{vA_{1\bar{2}}}{2\sqrt{2}m_{1\bar{2}}^2} & -\frac{1}{2} + \frac{1}{3}s_w^2 + \frac{v^2}{4} \left(\frac{|A_{1\bar{2}}|^2}{(m_{1\bar{2}}^2)^2} + \frac{|A_{\bar{2}3}|^2}{(m_{3\bar{2}}^2)^2} \right) & -\frac{vA_{\bar{2}3}}{2\sqrt{2}m_{3\bar{2}}^2} \\ -\frac{v^2A_{1\bar{2}}A_{\bar{2}3}^*}{4m_{1\bar{2}}^2m_{3\bar{2}}^2} & -\frac{vA_{\bar{2}3}^*}{2\sqrt{2}m_{3\bar{2}}^2} & \frac{1}{3}s_w^2 - \frac{v^2|A_{\bar{2}3}|^2}{4(m_{3\bar{2}}^2)^2} \end{pmatrix}, \\ \hat{\mathbb{Z}}^{+2/3} &\approx \begin{pmatrix} -\frac{1}{2} - \frac{2}{3}s_w^2 & \frac{v^2Y_{2\bar{2}}}{2m_{2\bar{2}}^2} & 0 \\ \frac{v^2Y_{2\bar{2}}^*}{2m_{2\bar{2}}^2} & \frac{1}{2} - \frac{2}{3}s_w^2 + \frac{v^2|A_{\bar{2}3}|^2}{2(m_{\bar{2}3}^2)^2} & -\frac{vA_{\bar{2}3}}{2m_{\bar{2}3}^2} \\ 0 & -\frac{vA_{\bar{2}3}^*}{2m_{\bar{2}3}^2} & 1 - \frac{2}{3}s_w^2 - \frac{v^2|A_{\bar{2}3}|^2}{2(m_{\bar{2}3}^2)^2} \end{pmatrix}, \\ \hat{\mathbb{Z}}^{-4/3} &\approx \begin{pmatrix} \frac{4}{3}s_w^2 & -\frac{v^2Y_{\bar{1}3}^*}{\sqrt{2}m_{1\bar{3}}^2} \\ -\frac{v^2Y_{\bar{1}3}}{\sqrt{2}m_{1\bar{3}}^2} & -1 + \frac{4}{3}s_w^2 \end{pmatrix}, \quad \hat{\mathbb{Z}}^{+5/3} = \left(\frac{1}{2} - \frac{5}{3}s_w^2 \right), \\ \hat{\mathbb{W}}_{-1/3}^{+2/3} &\approx \begin{pmatrix} 0 & \frac{v^2Y_{2\bar{2}}}{2m_{2\bar{2}}^2} & 0 \\ \frac{vA_{1\bar{2}}}{\sqrt{2}m_{1\bar{2}}^2} & 1 + \frac{v^2}{4} \left(\frac{|A_{\bar{2}3}|^2}{(m_{\bar{2}3}^2)^2} - \frac{|A_{1\bar{2}}|^2}{(m_{1\bar{2}}^2)^2} \right) & \frac{vA_{\bar{2}3}}{\sqrt{2}m_{\bar{2}3}^2} \\ \frac{v^2}{\sqrt{2}m_{1\bar{3}}^2} \left(\frac{A_{1\bar{2}}A_{\bar{2}3}^*}{m_{\bar{2}3}^2} - Y_{13}^* \right) & 0 & -\sqrt{2} + \frac{v^2|A_{\bar{2}3}|^2}{2\sqrt{2}(m_{\bar{2}3}^2)^2} \end{pmatrix}, \\ \hat{\mathbb{W}}_{-4/3}^{-1/3} &\approx \begin{pmatrix} 0 & \frac{v^2}{\sqrt{2}m_{1\bar{3}}^2} \left(Y_{13} + \frac{A_{\bar{2}3}A_{1\bar{2}}^*}{m_{1\bar{2}}^2} \right) \\ 0 & \frac{vA_{\bar{2}3}}{m_{\bar{2}3}^2} \\ \frac{v^2Y_{\bar{1}3}}{m_{1\bar{3}}^2} & \sqrt{2} - \frac{v^2|A_{\bar{2}3}|^2}{2\sqrt{2}(m_{\bar{2}3}^2)^2} \end{pmatrix}, \quad \hat{\mathbb{W}}_{+2/3}^{+5/3} \approx \left(1 - \frac{v^2Y_{2\bar{2}}}{2m_{2\bar{2}}^2} \ 0 \right), \end{aligned} \tag{42}$$

up to $\mathcal{O}(v^2)$, where again $m_{ab}^2 \equiv m_a^2 - m_b^2$ for $a, b \in \{1, \bar{1}, 2, \bar{2}, 3\}$.

3.3. Interactions with SM Fermions (\mathcal{L}_f)

The interactions between the five scalar LQs and the SM fermions are listed below. Y_a^{AB} with $a \in \{1, \tilde{1}, 2, \tilde{2}, 3\}$ and $A, B \in \{L, R\}$ are arbitrary complex 3×3 matrices coupling LQs to a quark and a lepton. $Y_a^{Q,AA}$ with $a \in \{1, \tilde{1}, 2, \tilde{2}, 3\}$ and $A \in \{L, R\}$ couple LQs to two quarks. $Y_1^{Q,LL}$ is symmetric in flavour space (i.e. $Y_{1,ij}^{Q,LL} = Y_{1,ji}^{Q,LL}$), $Y_{\tilde{1}}^{Q,RR}$ and $Y_3^{Q,LL}$ are anti-symmetric and $Y_1^{Q,RR}$ is again an arbitrary complex matrix. We omit the color indices whenever they just involve trivial contractions.

	\mathcal{L}_f
Φ_1	$Y_{1,ij}^{RR} \bar{u}'_i c \ell'_j \Phi_1^\dagger + Y_{1,ij}^{LL} (\bar{Q}'^{c\tau}_i i\sigma_2 L'_j) \Phi_1^\dagger + \text{h.c.}$
	$Y_{1,ij}^{Q,LL} (\bar{Q}'^{c\tau}_{i,c_1} i\sigma_2 Q'_{j,c_2}) \Phi_{1,c_3} \epsilon^{c_1 c_2 c_3} + \text{h.c.}$
	$Y_{1,ij}^{Q,RR} \bar{u}'_{i,c_1} d'_{j,c_2} \Phi_{1,c_3} \epsilon^{c_1 c_2 c_3} + \text{h.c.}$
$\Phi_{\tilde{1}}$	$Y_{\tilde{1},ij}^{RR} \bar{d}'_i c \ell'_j \Phi_{\tilde{1}}^\dagger + \text{h.c.}$
	$Y_{\tilde{1},ij}^{Q,RR} \bar{u}'_{i,c_1} u'_{j,c_2} \Phi_{\tilde{1},c_3} \epsilon^{c_1 c_2 c_3} + \text{h.c.}$
Φ_2	$Y_{2,ij}^{RL} (\Phi_2^\dagger \bar{u}'_i i\sigma_2 L'_j) + Y_{2,ij}^{LR} (\bar{Q}'^{c\tau}_i \ell'_j \Phi_2) + \text{h.c.}$
$\Phi_{\tilde{2}}$	$Y_{\tilde{2},ij}^{RL} (\Phi_{\tilde{2}}^\dagger \bar{d}'_i i\sigma_2 L'_j) + \text{h.c.}$
Φ_3	$Y_{3,ij}^{LL} (\bar{Q}'^{c\tau}_i i\sigma_2 (\sigma \cdot \Phi_3)^\dagger L'_j) + \text{h.c.}$
	$Y_{3,ij}^{Q,LL} (\bar{Q}'^{c\tau}_{i,c_1} i\sigma_2 (\sigma \cdot \Phi_{3,c_3}) Q'_{j,c_2}) \epsilon^{c_1 c_2 c_3} + \text{h.c.}$

Again, we use brackets to indicate the $SU(2)_L$ contractions. Note that we stated the Lagrangian above before EW symmetry breaking using the weak eigenstates of the fermions (indicated by the prime). When going to the mass eigenbasis (after EW symmetry breaking), CKM matrix elements enter interactions involving left-handed down-type quarks according to Eq. (20). The charge-conjugate of a fermion field Ψ is denoted as Ψ^c , where

$$\begin{aligned} \Psi^c &= C \bar{\Psi}^\dagger, \\ \bar{\Psi}^c &= -\Psi^\dagger C^{-1}, \end{aligned} \tag{44}$$

with C the charge conjugation matrix. A detailed description of our treatment of charge-conjugate SM fermions is given in Appendix A.

	LQ Fields (and their Y)

Table 1: Collection of all interaction terms with three LQ fields that result in a vanishing total weak hypercharge Y . The numbers in the table indicate the number of the corresponding LQ fields interacting in the vertex. The same combinations with all fields replaced by their anti-fields correspond to the Hermitian conjugates and are also valid solutions.

3.4. Triple LQ Interactions ($\mathcal{L}_{3\Phi}$)

Let us now turn to the LQ-LQ-LQ(-Higgs) interactions. In order to get a $SU(3)_c$ singlet, either three LQs or three anti-LQs have to be combined, since

$$\begin{aligned} 3 \otimes 3 \otimes 3 &= 1 \oplus 8 \oplus 8 \oplus 10 \\ \bar{3} \otimes \bar{3} \otimes \bar{3} &= 1 \oplus 8 \oplus 8 \oplus \bar{10} \end{aligned} \tag{45}$$

are the only tensor products of three $SU(3)$ (anti-)triplets $3, \bar{3}$ that contain a singlet. Regarding the hypercharge Y , one finds the possible combinations listed in Table 1. However, not all of these combinations can be implemented. Since the Lagrangian is symmetric under the exchange of identical bosons and the color terms are totally anti-symmetric, the $SU(2)_L$ part

needs to be anti-symmetric for identical bosons as well. This is not satisfied by $Y_{112}, Y_{1\tilde{1}2}, Y_{\tilde{2}\tilde{2}2}, A_{\tilde{2}\tilde{2}3}$ in Table 1. Hence, the Lagrangian is composed of the terms [175–178]

$$\begin{aligned}\mathcal{L}_{3\Phi} = & A_{1\tilde{2}2} \Phi_{1,c_1} \left(\Phi_{\tilde{2},c_2}^\dagger i\sigma_2 \Phi_{\tilde{2},c_3} \right) + A_{\tilde{1}2\tilde{2}} \Phi_{\tilde{1},c_1} \left(\Phi_{2,c_2}^\dagger i\sigma_2 \Phi_{\tilde{2},c_3} \right) \\ & + Y_{1\tilde{1}2} \Phi_{1,c_1} \Phi_{\tilde{1},c_2} \left(\Phi_{2,c_3}^\dagger i\sigma_2 H \right) + Y_{123} \Phi_{1,c_1} \left(H^\dagger (\sigma \cdot \Phi_{3,c_3}) \Phi_{2,c_2} \right) \\ & + Y_{1\tilde{2}3} \Phi_{1,c_1} \left(\Phi_{\tilde{2},c_2}^\dagger i\sigma_2 (\sigma \cdot \Phi_{3,c_3}) H \right) + Y_{\tilde{1}23} \Phi_{\tilde{1},c_1} \left(\Phi_{2,c_2}^\dagger i\sigma_2 (\sigma \cdot \Phi_{3,c_3}) H \right) \\ & + Y_{233} \left(H^\dagger \sigma^I \Phi_{2,c_1} \right) \left(\Phi_{3,c_2}^J i\epsilon^{IJK} \Phi_{3,c_3}^K \right) \\ & + Y_{\tilde{2}33} \left(\Phi_{\tilde{2},c_1}^\dagger i\sigma_2 \sigma^I H \right) \left(\Phi_{3,c_2}^J i\epsilon^{IJK} \Phi_{3,c_3}^K \right) \\ & + \text{h.c.}\end{aligned}\tag{46}$$

The Levi-Civita tensors $\epsilon^{c_1 c_2 c_3}$ are omitted, such that i.e. the first term would read $A_{1\tilde{2}2} \epsilon^{c_1 c_2 c_3} \Phi_{1,c_1} \left(\Phi_{\tilde{2},c_2}^\dagger i\sigma_2 \Phi_{\tilde{2},c_3} \right)$ in the full notation.

3.5. Quartic LQ Interactions ($\mathcal{L}_{4\Phi}$)

To get four-LQ interaction terms in the Lagrangian, one needs to combine two LQs and two anti-LQs, since

$$3 \otimes \bar{3} \otimes 3 \otimes \bar{3} = 1 \oplus 1 \oplus 8 \oplus 8 \oplus 8 \oplus 8 \oplus 10 \oplus \bar{10} \oplus 27\tag{47}$$

is the only tensor product of four $SU(3)_c$ fundamental representations $(3, \bar{3})$ that contains a singlet. Trivial combinations of LQ fields that contribute to the four-LQ Lagrangian are of the type

$$\begin{aligned}Y_a^{(1)} \left(\Phi_{a,c_1}^\dagger \Phi_{a,c_1} \right) \left(\Phi_{a,c_2}^\dagger \Phi_{a,c_2} \right), \\ Y_{ab}^{(1)} \left(\Phi_{a,c_1}^\dagger \Phi_{a,c_1} \right) \left(\Phi_{b,c_2}^\dagger \Phi_{b,c_2} \right),\end{aligned}\tag{48}$$

where $a \neq b \in \{1, \tilde{1}, 2, \tilde{2}, 3\}$. All additional combinations that result in a vanishing total weak hypercharge Y are given in Tab. 2. Taking into account $SU(2)_L$ invariance, the terms corresponding to Y_{1113} and $Y_{1\tilde{1}\tilde{1}3}$ cannot be implemented, but besides $Y_2^{(1)}, Y_{\tilde{2}}^{(1)}, Y_3^{(1)}, Y_{2\tilde{2}}^{(1)}, Y_{23}^{(1)}$ and $Y_{\tilde{2}3}^{(1)}$, further independent terms with the same fields exist, originating from the different $SU(2)_L$ singlets that can be constructed. Regarding $SU(3)_c$, except for the case when two fields are identical, there are two possibilities to contract the

		LQ Fields (and their Y)				
		Φ_1, Φ_1^\dagger	$\Phi_{\tilde{1}}, \Phi_{\tilde{1}}^\dagger$	Φ_2, Φ_2^\dagger	$\Phi_{\tilde{2}}, \Phi_{\tilde{2}}^\dagger$	Φ_3, Φ_3^\dagger
		$-\frac{1}{3}, \frac{1}{3}$	$-\frac{4}{3}, \frac{4}{3}$	$\frac{7}{6}, -\frac{7}{6}$	$\frac{1}{6}, -\frac{1}{6}$	$-\frac{1}{3}, \frac{1}{3}$
Interaction Terms	Y_{1113}	1, 2	0, 0	0, 0	0, 0	1, 0
	$Y_{1\tilde{1}\tilde{1}3}$	0, 1	1, 1	0, 0	0, 0	1, 0
	$Y_{1\tilde{1}\tilde{2}2}$	0, 1	1, 0	1, 0	0, 1	0, 0
	Y_{1223}	0, 1	0, 0	1, 1	0, 0	1, 0
	$Y_{1\tilde{2}\tilde{2}3}$	0, 1	0, 0	0, 0	1, 1	1, 0
	Y_{1313}	0, 2	0, 0	0, 0	0, 0	2, 0
	Y_{1333}	0, 1	0, 0	0, 0	0, 0	2, 1
	$Y_{\tilde{1}\tilde{2}23}$	0, 0	0, 1	0, 1	1, 0	1, 0

Table 2: Collection of all interaction terms with four LQ fields that result in a vanishing total weak hypercharge Y . We do not include the trivial combinations stated in Eq. (48). The numbers in the table indicate the number of the corresponding LQ fields in the interaction term. The same combinations with all fields replaced by their anti-fields (i.e. with the pairs listed in the table permuted) correspond to the Hermitian conjugates and are also valid solutions.

color indices tracing back to the two singlets in Eq. 47. We distinguish them by different couplings Y and Y' for full generality. This yields the Lagrangian

$$\begin{aligned}
\mathcal{L}_{4\Phi} = & \frac{1}{2} \sum_a Y_a^{(1)} (\Phi_{a,c_1}^\dagger \Phi_{a,c_1}) (\Phi_{a,c_2}^\dagger \Phi_{a,c_2}) \\
& + \frac{1}{2} \sum_{a=2,\tilde{2},3} Y_a^{(3)} (\Phi_{a,c_1}^\dagger \Phi_{a,c_2}) (\Phi_{a,c_2}^\dagger \Phi_{a,c_1}) \\
& + \frac{1}{2} Y_3^{(5)} (\Phi_{3,c_1}^{I\dagger} \Phi_{3,c_1}^J \Phi_{3,c_2}^{I\dagger} \Phi_{3,c_2}^J) \\
& + \sum_{a \neq b} \left(Y_{ab}^{(1)} \delta_{c_1 c_2} \delta_{c_3 c_4} + Y'_{ab}^{(1)} \delta_{c_1 c_4} \delta_{c_2 c_3} \right) (\Phi_{a,c_1}^\dagger \Phi_{a,c_2}) (\Phi_{b,c_3}^\dagger \Phi_{b,c_4}) \\
& + \left(Y_{2\tilde{2}}^{(3)} \delta_{c_1 c_2} \delta_{c_3 c_4} + Y'_{2\tilde{2}}^{(3)} \delta_{c_1 c_4} \delta_{c_2 c_3} \right) (\Phi_{2,c_1}^\dagger \Phi_{\tilde{2},c_2}) (\Phi_{\tilde{2},c_3}^\dagger \Phi_{2,c_4})
\end{aligned}$$

$$\begin{aligned}
& + \sum_{a=2,\tilde{2}} \left(Y_{a3}^{(3)} \delta_{c_1 c_2} \delta_{c_3 c_4} + Y'_{a3}^{(3)} \delta_{c_1 c_4} \delta_{c_2 c_3} \right) \left(\Phi_{a,c_1}^\dagger \sigma^I \Phi_{a,c_2} \right) \left(\Phi_{3,c_3}^{J\dagger} i \epsilon^{IJK} \Phi_{3,c_4}^K \right) \\
& + \left[\sum_{a=2,\tilde{2}} \left(Y_{1aa3} \delta_{c_1 c_2} \delta_{c_3 c_4} + Y'_{1aa3} \delta_{c_1 c_4} \delta_{c_2 c_3} \right) \Phi_{1,c_1}^\dagger \left(\Phi_{a,c_3}^\dagger (\sigma \cdot \Phi_{3,c_4}) \Phi_{a,c_2} \right) \right. \\
& \quad + \left(Y_{1\tilde{2}23} \delta_{c_1 c_2} \delta_{c_3 c_4} + Y'_{1\tilde{2}23} \delta_{c_1 c_4} \delta_{c_2 c_3} \right) \Phi_{1,c_1}^\dagger \left(\Phi_{2,c_3}^\dagger (\sigma \cdot \Phi_{3,c_4}) \Phi_{2,c_2} \right) \\
& \quad + \left(Y_{1\tilde{1}\tilde{2}2} \delta_{c_1 c_2} \delta_{c_3 c_4} + Y'_{1\tilde{1}\tilde{2}2} \delta_{c_1 c_4} \delta_{c_2 c_3} \right) \Phi_{1,c_1}^\dagger \Phi_{\tilde{1},c_2}^\dagger \left(\Phi_{2,c_3}^\dagger \Phi_{2,c_4} \right) \\
& \quad + \frac{1}{2} Y_{1313} \delta_{c_1 c_2} \delta_{c_3 c_4} \left(\Phi_{1,c_1}^\dagger \Phi_{3,c_2}^I \Phi_{1,c_3}^\dagger \Phi_{3,c_4}^I \right) \\
& \quad \left. + Y_{1333} \delta_{c_1 c_2} \delta_{c_3 c_4} \left(\Phi_{1,c_1}^\dagger \Phi_{3,c_2}^I \Phi_{3,c_3}^{J\dagger} \Phi_{3,c_4}^K i \epsilon^{IJK} \right) + \text{h.c.} \right], \tag{49}
\end{aligned}$$

with $a, b \in \{1, \tilde{1}, 2, \tilde{2}, 3\}$ unless stated otherwise. Note that we set $Y_{ab}^{(1)} = Y_{ba}^{(1)}$ and $Y_{ab}^{(1)\prime} = Y_{ba}^{(1)\prime}$ for $a \neq b$, since they correspond to the same terms. The Feynman rules are expressed using only one of them, i.e. $Y_{13}^{(1)}$, but not $Y_{3\tilde{1}}^{(1)}$.

4. Methods

The determination of the Feynman rules to be presented in Chapters 5 and 6 is carried out using the Mathematica package FeynRules 2.3.36 [166]. All model files and the Mathematica notebook needed to display and export the Feynman rules can be found online at GitLab. In the following, the structure of the code files will be discussed. For more information about FeynRules, the interested reader is referred to Ref. [166].

4.1. *GitLab Project*

This GitLab project can be accessed under

<https://gitlab.com/lucschnell/SLQrules>.

SLQrules.nb contains a Mathematica notebook that is used to determine the Feynman rules and to export them to MadGraph or FeynArts. The FeynRules model files can be found in the folder SLQrules. In order to use them, download the entire folder and add it to the FeynRules directory FeynRules/Models on your computer. We also provide prefabricated MOD and UFO model files that can be used in FeynArts [167] and MadGraph [168].

4.1.1. *Mathematica Notebook*

The notebook SLQrules.nb is used to display and export the Feynman rules. Having loaded the model files, the different parts of the Lagrangian can be accessed via the FeynRules variable names shown in Table 3.

Lagrangian	Variable name
\mathcal{L}^{LQ}	LQall
$\mathcal{L}_{2\Phi}$	LQ2Phi
\mathcal{L}_{kin}	LQkin .
\mathcal{L}_f	LQf
$\mathcal{L}_{3\Phi}$	LQ3Phi
$\mathcal{L}_{4\Phi}$	LQ4Phi

Table 3: Variable names of the Lagrangians defined in Sec. 3.

For example,

```
1 FeynmanRules[LQall];
```

is used to determine the Feynman rules for the entire Lagrangian \mathcal{L}^{LQ} . The Feynman rules can be exported as UFO files for MadGraph. This is done via the command

```
1 FeynmanGauge = False;
2 WriteUFO[LSM + LQall, Output -> "SLQrules-UFO"];
```

The boolean FeynmanGauge on line 1 is used to switch between Feynman and unitary gauge. The files are exported to SLQrules/SLQrules-UFO in your FeynRules directory. We also provide ready-to-use UFO files for \mathcal{L}^{LQ} , these can be found under SLQrules/UFO in the GitLab project. Similarly, the export for FeynArts is carried out using

```
1 FeynmanGauge = False;
2 WriteFeynArtsOutput[LSM + LQall, Output -> "SLQrules-FA"];
```

We provide prefabricated FeynArts files under SLQrules/FeynArts. Additionally, the export to Sherpa, CalcHep or Whizard is possible. The corresponding commands can be found in SLQrules.nb, but we opt not to include prefabricated files for these applications. The package NLOCT 1.0 [179] even allows for the automatic determination of UV and R_2 counterterms, making the export of NLO models possible. We include corresponding commands in SLQrules.nb, but note that these determinations become highly time-consuming for complex models (i.e. involving LQ mixing). In this work we only consider models at tree-level.

4.1.2. Model Files

The FeynRules model files are located in the folder SLQrules. They are based on existing model files for the SM [166] and the individual scalar LQ representations [180]. The scalar LQ fields defined in Ref. [180] were merged into the model file SLQrules/SLQrules.fr and their interactions with two SM quarks, as well as the LQ-LQ-Higgs(-Higgs), LQ-LQ-LQ(-Higgs) and LQ-LQ-LQ-LQ interactions were added. The file SLQrules.fr consists of three parts:

- (i) the parameter definitions,
- (ii) the definition of the LQ fields and
- (iii) the LQ Lagrangian.

To exemplify (i), a generic parameter definition is shown in Listing 1. The full list of all parameter definitions is given in the README.md file of SLQrules.

```

1 Y13 == {
2     ParameterType    -> External ,
3     ComplexParameter -> True ,
4     Indices          -> {} ,
5     BlockName        -> Y13 ,
6     TeX              -> Subscript[Y, "13"] ,
7     Value             -> 1.0 ,
8     InteractionOrder -> {QED, 2} ,
9     Description       -> "S3-S1 scalar leptoquark mixing
10                           coupling"
11 },

```

Listing 1: Parameter definition (coupling Y_{13})

We set the values of all couplings to unity per default. The QED interaction order of Y_{13} is set to 2, since this interaction involves two Higgs fields. An example for (ii), the definition of a LQ field, is given in Listing 2. The original fields Φ_a before the diagonalization of the mass terms are defined as unphysical fields, whereas the fields $\hat{\Phi}_a$ represent the physical fields in the FeynRules code. In this way, Φ_a can be used when defining LQ Lagrangians (see below) and the FeynRules code automatically replaces them by the corresponding mass eigenstates $\hat{\Phi}_a$ and the rotation matrices W^q

$$\Phi_a^q = W_{n_b n_a}^{q*} \hat{\Phi}_b^q \quad (50)$$

Such a replacement is defined for Φ_1 on the lines 25-30 of Listing 2.

```

1 (* physical fields *)
2 S[100] == {
3     ClassName      -> S1m13hat ,
4     Mass           -> {m1m13hat , Internal} ,
5     Width          -> {W1m13hat , Internal} ,
6     SelfConjugate   -> False ,
7     PropagatorLabel -> "S1m13hat" ,
8     PropagatorType   -> ScalarDash ,
9     PropagatorArrow   -> None ,
10    QuantumNumbers  -> {Q -> -1/3} ,
11    Indices         -> {Index[Colour]} ,
12    ParticleName    -> "S1m13hat" ,
13    AntiParticleName -> "S1m13hat~" ,
14    FullName        -> "S1m13hat"

```

```

15 } ,
16
17 (* unphysical fields *)
18 S[101] == {
19   ClassName      -> S1m13 ,
20   Unphysical     -> True ,
21   SelfConjugate  -> False ,
22   QuantumNumbers -> {Y -> -1/3} ,
23   Indices         -> {Index[Colour]} ,
24   Definitions    -> {S1m13[cc_] :> HC[W13mat[1,1]]
25                                S1m13hat[cc]
26                                + HC[W13mat[2,1]]
27                                R2tm13hat[cc]
28                                + HC[W13mat[3,1]]
29                                S3m13hat[cc]}
30 }

```

Listing 2: Leptoquark field definition (singlet field Φ_1)

Finally, to exemplify the definition of (iii), the Lagrangian for the LQ-LQ-Higgs interaction

$$Y_{\tilde{2}33} \left(\Phi_{\tilde{2},c_1}^T i\sigma_2 \sigma^I H \right) \left(\Phi_{3,c_2}^J i\epsilon^{IJK} \Phi_{3,c_3}^K \right) + \text{h.c.}, \quad (51)$$

is given in Listing 3. Single lowercase letters (a, b, c) are used to refer to the weak doublet indices, single capital letters (D, E, F) to refer to the weak triplet indices and double lowercase letters (aa, bb, cc) are color indices. As described above, so-called unphysical fields ($\Phi_{\tilde{2}}, \Phi_3$) are used in the definition of the Lagrangian, which are later replaced automatically by the physical fields ($\hat{\Phi}_{\tilde{2}}^{+2/3}, \hat{\Phi}_{\tilde{2}}^{-1/3}, \hat{\Phi}_3^{-1/3}, \hat{\Phi}_3^{+2/3}$ and $\hat{\Phi}_3^{-4/3}$ in this case).

```

1 L2t33NonHC := Module[ {a,b,c,D,E,F,aa,bb,cc},
2 ExpandIndices[ Y2t33 R2t[a,aa] Eps[a,b]
3   2*Ta[D,b,c] Phi[c] S3[E,bb] I*Eps[D,E,F] S3[F,cc]
4   Eps[aa,bb,cc],
5   FlavorExpand->{SU2D, SU2W}]];
6 L2t33 := L2t33NonHC + HC[L2t33NonHC];

```

Listing 3: Lagrangian definition (LQ interaction corresponding to $Y_{\tilde{2}33}$).

The assignment of `FlavorExpand` on line 5 makes sure that both $\Phi_{\tilde{2}}$ and Φ_3 are expanded into their $SU(2)_L$ components.

5. SM Feynman Rules

5.1. External Fields

The Feynman rules for the external legs are listed in this subsection. See Ref. [181] for details. $u^{(s)}$ and $v^{(s)}$ denote the spinors for particles and antiparticles, respectively, and s is the spin. The polarization tensors for the gauge bosons are denoted by ϵ_μ . The circles denote the generic reminder of the Feynman diagram.

5.2. Propagators

The propagators for the SM particles are given below. We work in Feynman gauge. The fermion masses $m_{\ell_i}, m_{u_i}, m_{d_i}$ are defined in Eq. (18), the gauge boson masses m_W, m_Z in Eq. (14).

Fermion Propagators

Diagram	Feynman Rule
$\ell_i \xrightarrow[p]{\quad} \ell_i$	$\frac{i(\not{p} + m_{\ell_i})}{p^2 - m_{\ell_i}^2 + i\epsilon}$
$\nu_i \xrightarrow[p]{\quad} \nu_i$	$\frac{i\not{p}}{p^2 + i\epsilon}$
$u_{i,c_1} \xrightarrow[p]{\quad} u_{i,c_1}$	$\frac{i(\not{p} + m_{u_i})}{p^2 - m_{u_i}^2 + i\epsilon}$
$d_{i,c_1} \xrightarrow[p]{\quad} d_{i,c_1}$	$\frac{i(\not{p} + m_{d_i})}{p^2 - m_{d_i}^2 + i\epsilon}$

Gauge Boson Propagators

6. Scalar LQ Feynman Rules

In this section we state the Feynman rules for all LQ interactions. We write $\hat{\Phi}_a^q$ with $q \in \{-\frac{4}{3}, -\frac{1}{3}, +\frac{2}{3}, +\frac{5}{3}\}$ and $a \in \{1, \tilde{1}, 2, \tilde{2}, 3\}$. For $q = +\frac{5}{3}$, $\hat{\Phi}^{+5/3}$ is just a single field, therefore the subscript a is omitted. The LQ electric charge eigenstate vectors are given in Eq. (26).

6.1. External Fields

In this subsection, the Feynman rules for the external legs are listed. The circles denote the generic reminder of the Feynman diagram.

External LQs	
Diagram	Feynman Rule
	1

6.2. Propagators

The propagator for the LQ fields is listed below. The diagonalized mass matrices \hat{M}_{ab}^q are given in Eq. (32).

LQ Propagator	
Diagram	Feynman Rule
	$\frac{i}{p^2 - (\hat{M}_{aa}^q)^2 + i\epsilon}$

6.3. Interactions with SM Fermions

The Feynman rules for LQ interactions with the SM fermions are given below. All fields are defined to be incoming. We omit the color indices whenever they just involve trivial contractions. We express some of the rules using n_a^q , which is defined in Eq. (36). Whenever q is clear from the context, we write n_a^q as n_a to simplify the notation. The bar labels an antifermion. Note that while there is an equivalence between a fermion field f and \bar{f}^c , stating Feynman rules for \bar{f}^c makes sense in our treatment of charge-conjugate fermions. A detailed explanation is given in Appendix A.

7. Conclusions

In this article we provided the complete scalar LQ Lagrangian, including all interactions with SM fermions, gauge bosons and the Higgs. After EW symmetry breaking the mass terms of the Lagrangian are diagonalized, leading to mixing among different LQ representations. We present all Feynman rules, including for the first time the LQ-LQ-LQ(-Higgs) and LQ-LQ-LQ-LQ interactions. On the computational side, we provided a FeynRules model file containing the complete scalar LQ Lagrangian, as well as a Mathematica notebook to access it. The export to MadGraph and FeynArts is possible and the corresponding files are provided, rendering this a powerful tool for the automatization of studies of scalar LQ phenomenology.

Appendix A. Charge-Conjugate SM Fermions

Appendix A.1. Treatment of Charge-Conjugate SM Fermions

Our treatment of interactions involving charge-conjugate SM fermions is based on the method of Ref. [181]. It uses the properties of the charge-conjugation matrix C (introduced in Eq. (44)) [181, 182]

$$\begin{aligned} C^\dagger &= C^{-1}, \\ C^\Gamma &= -C, \\ C\Gamma_i^\dagger C^{-1} &= \eta_i \Gamma_i \equiv \Gamma'_i, \end{aligned} \tag{A.1}$$

with $\Gamma_i = 1, i\gamma^5, \gamma^\mu, \gamma^\mu\gamma^5, \sigma^{\mu\nu}$ and

$$\eta_i = \begin{cases} +1, & \text{for } \Gamma_i = 1, i\gamma^5, \gamma^\mu\gamma^5 \\ -1, & \text{for } \Gamma_i = \gamma^\mu, \sigma^{\mu\nu} \end{cases} \tag{A.2}$$

to derive two equivalent sets of Feynman rules for internal propagators, external lines and vertices involving (anti-)fermions. The first set corresponds to the expressions $\bar{\psi}_1 \Gamma_i \psi_2$ that appear in the Lagrangian, the second set to their charge-conjugate analogues $\bar{\psi}_2^c \Gamma'_i \psi_1^c$. The two are equivalent

$$\bar{\psi}_1 \Gamma_i \psi_2 = \bar{\psi}_2^c \Gamma'_i \psi_1^c. \tag{A.3}$$

This double allocation allows for an intuitive treatment of interactions involving charge-conjugate fermion fields. While the underlying principle is the same, our notation differs from Ref. [181]. We use two types of arrows on the fermion lines (black and white ones) instead of additional arrows next to them. This avoids potential confusion with momentum arrows as well as having clashing fermion arrows. We proceed by stating the recipe for calculating Feynman amplitudes for processes involving charge-conjugate fermions, which we demonstrate using an example. The Feynman rules for diagrams featuring charge-conjugate SM fermions only are given in Appendix A.2.

Prescription for the Evaluation of Feynman diagrams

The amplitudes for specific processes are determined according to the following prescription:

- Draw all Feynman diagrams for a given process. Two fermion lines with clashing arrows (i.e. one line ending in a fermion and the other in its charge-conjugate) may be connected by inverting the direction and the colors of the arrows for one of the two lines. It does not matter which of the two lines are inverted.
- For each internal propagator, external line and vertex write down the appropriate analytic expressions proceeding opposite to the fermion flow. The Feynman rules for normal fermions (black arrows) are given in Sec. 5, the rules for charge-conjugated fermions (white arrows) in Appendix A.2 and the rules involving both in Sec. 6.3.
- Multiply by a factor (-1) for every closed loop.
- Multiply by the permutation parity of the spinors in the obtained analytical expression with respect to some reference order.

The evaluation of the bosonic parts of a diagram proceed as usual.

Example

In order to exemplify our Feynman rules, we calculate the Feynman amplitude for the process $e\nu_\mu \rightarrow \Phi_1^{-1/3}\Phi_2^{-2/3}$ with an up quark t -channel contribution. A similar example is given in Sec. 4 of Ref. [181], which allows for a direct comparison of our notation to theirs. For simplicity, we neglect the mixing among the LQs and take the SM fermions to be massless.

The Feynman diagram is shown in Fig. A.1. Fig. A.1a shows two parts of the diagram with clashing fermion line arrows for the up quark. In order to combine the two parts, the fermion arrows of one of them have to be inverted. In Fig. A.1b, the arrows of the upper part are inverted, in Fig. A.1c the ones of the lower part. In the following, we will derive the analytic expressions for both of them, showing their equivalence. Choosing the reference order $(1, 2)$ for the external states, the Feynman amplitude for the diagram in Fig. A.1b

Figure A.1: Feynman diagrams for the process $e\nu_\mu \rightarrow \Phi_1^{-1/3}\Phi_2^{-2/3}$ involving a t -channel up quark. The up quark fermion lines with clashing arrows shown in the diagram on the left can be combined by inverting the fermion arrows (color and direction) of one of the two subdiagrams. This yields the two equivalent diagrams on the right.

reads

$$\begin{aligned} i\mathcal{M} &= \bar{v}^{(s_1)}(\vec{p}_1) \left(+iY_{1,11}^{LL}P_L + iY_{1,11}^{RR}P_R \right) \frac{-iq}{q^2 + i\epsilon} \left(-iY_{2,12}^{RL}P_L \right) u^{(s_2)}(\vec{p}_2) \\ &= -i \frac{Y_{1,11}^{RR}Y_{2,12}^{RL}}{q^2 + i\epsilon} \bar{v}^{(s_1)}(\vec{p}_1) q P_L u^{(s_2)}(\vec{p}_2). \end{aligned} \quad (\text{A.4})$$

The amplitude for the diagram in Fig. A.1c is

$$\begin{aligned} i\mathcal{M}' &= (-1) \bar{v}^{(s_2)}(\vec{p}_2) \left(-iY_{2,12}^{RL}P_L \right) \frac{iq}{q^2 + i\epsilon} \left(+iY_{1,11}^{LL}P_L + iY_{1,11}^{RR}P_R \right) u^{(s_1)}(\vec{p}_1) \\ &= -i \frac{Y_{1,11}^{RR}Y_{2,12}^{RL}}{q^2 + i\epsilon} \bar{v}^{(s_2)}(\vec{p}_2) q P_R u^{(s_1)}(\vec{p}_1), \end{aligned} \quad (\text{A.5})$$

where the factor (-1) is added since the order of the external states is now

reversed. The two amplitudes are equivalent, since

$$\begin{aligned}
i\mathcal{M} &\propto \bar{v}^{(s_1)}(\vec{p}_1) \not{P}_{\text{L}} u^{(s_2)}(\vec{p}_2) = q_\mu \bar{v}^{(s_1)}(\vec{p}_1) \frac{\gamma^\mu - \gamma^\mu \gamma^5}{2} u^{(s_2)}(\vec{p}_2) \\
&= q_\mu u^{(s_2)\top}(\vec{p}_2) \frac{\gamma^{\mu\top} - (\gamma^\mu \gamma^5)^\top}{2} \bar{v}^{(s_1)}(\vec{p}_1)^\top \\
&= q_\mu u^{(s_2)\top}(\vec{p}_2) C^{-1} \frac{-\gamma^\mu - \gamma^\mu \gamma^5}{2} C \bar{v}^{(s_1)}(\vec{p}_1)^\top \\
&= q_\mu \bar{v}^{(s_2)}(\vec{p}_2) \frac{\gamma^\mu + \gamma^\mu \gamma^5}{2} u^{(s_1)}(\vec{p}_1) = \bar{v}^{(s_2)}(\vec{p}_2) \not{P}_{\text{R}} u^{(s_1)}(\vec{p}_1) \propto i\mathcal{M}' ,
\end{aligned} \tag{A.6}$$

where we have used Eq. (A.1) and

$$\begin{aligned}
u^{(s)}(\vec{p}) &= C \bar{v}^{(s)}(\vec{p})^\top , \\
v^{(s)}(\vec{p}) &= C \bar{u}^{(s)}(\vec{p})^\top
\end{aligned} \tag{A.7}$$

for spinors u, v , which can be derived from Eq. (44). This equivalence is true for all Feynman diagrams involving charge-conjugate fermions, as argued in Ref. [181].

*Appendix A.2. Charge-Conjugate SM Fermion Feynman Rules
External Fields*

The Feynman rules for the external charge-conjugate fermions are listed in this section. See Ref. [181] for details.

External Fermions		
Diagram	Feynman Rule	
	$u^{(s)}(\vec{p})$	
	$\bar{u}^{(s)}(\vec{p})$	
	$v^{(s)}(\vec{p})$	
	$\bar{v}^{(s)}(\vec{p})$	

Propagators

The propagators for the charge-conjugate SM fermions are given below. The fermion masses $m_{\ell_i}, m_{u_i}, m_{d_i}$ are defined in Eq. (18).

Fermion Propagators		
Diagram	Feynman Rule	
$\ell_i^c \xrightarrow[p]{\quad} \ell_i^c$	$\frac{i(\not{p} + m_{\ell_i})}{p^2 - m_{\ell_i}^2 + i\epsilon}$	
$\nu_i^c \xrightarrow[p]{\quad} \nu_i^c$	$\frac{i\not{p}}{p^2 + i\epsilon}$	
$u_{i,c_1}^c \xrightarrow[p]{\quad} u_{i,c_1}^c$	$\frac{i(\not{p} + m_{u_i})}{p^2 - m_{u_i}^2 + i\epsilon}$	
$d_{i,c_1}^c \xrightarrow[p]{\quad} d_{i,c_1}^c$	$\frac{i(\not{p} + m_{d_i})}{p^2 - m_{d_i}^2 + i\epsilon}$	

Interactions with SM Gauge Bosons

The Feynman rules for charge-conjugate SM fermion fields interacting with SM gauge fields are given below.
